South Fork Snake and Teton Rivers Yellowstone Cutthroat Trout Fishery

Native Yellowstone cutthroat trout are highly valued by South Fork anglers for their aggressive nature and fast growth. Non-native rainbow trout not only compete with Yellowstone cutthroat trout, but they also interbreed with them, producing hybrids. Hybridization is a serious threat to the native cutthroat trout fishery. Idaho Fish and Game is attempting to minimize the level of hybridization in the South Fork by encouraging anglers to harvest rainbow trout, and by using traps to prevent rainbows from spawning in important cutthroat trout spawning tributaries. With your support, these efforts will help ensure this healthy Yellowstone cutthroat population and unique angling opportunity will be around for generations to come. So enjoy a shore lunch, or take some South Fork rainbow trout home for dinner – you'll be doing the fishery a favor!

Hybrid description: Cutthroat/rainbow trout hybrids display variable color and markings representing a range of shared characteristics from rainbow and cutthroat trout. All hybrids show spotting patterns similar to rainbow trout with spots more evenly distributed from head to tail and above and below the lateral line. Yellowstone cutthroat/rainbow trout hybrids in the South Fork Snake River drainage are most easily identified by the presence of white fin tips.

Henrys Fork (Snake River, North Fork) See Page 33 for specific boundaries.
